

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) A computer-implemented method for predicting at least one amino acid sequence that folds into a specified three-dimensional (3D) structure of a predetermined reference protein or peptide, the at least one amino acid sequence having a biological activity the same as a biological activity of the reference protein or peptide; which method comprises the steps of:

a) providing a coordinate set representing the backbone of the 3D structure;

b) constructing a reduced virtual representation for the 3D structure provided in step (a), wherein in the reduced representation, each amino acid has a backbone portion and a side chain portion, the backbone portion of each amino acid being represented by a single sphere and the side chain of each amino acid being represented by one to three additional spheres;

c) determining for each amino acid position along the virtual structure representation provided in step (b) its solvent accessibility;

d) constructing an initial amino acid sequence by assigning for each amino acid position along the structure an amino acid residue selected randomly from a predefined group of amino acids having a solvent

accessibility compatible with the solvent accessibility of the position;

e) randomly selecting one or more positions along the sequence provided in step (d) and applying on each position a Monte-Carlo simulation in sequence space and rotamer space, the simulation comprising one or more scoring function calculating steps which include:

i) randomly selecting one or more amino acid residues of the same solvent accessibility as that defined for the position to obtain a mutation;

ii) for each of the one or more selected positions, calculating an energy difference ΔE , between the amino acid residue at the position in the predetermined protein or peptide and each of the one or more selected amino acid residues provided in step (i) based on its the reduced virtual representation;

iii) selecting a rotamer having a minimal ΔE , or when more than one amino acid are manipulated simultaneously, selecting a rotamer combination having a minimal ΔE ;

iv) accepting the mutation with the rotamer or rotamer combination selected in step (iii) if $\Delta E < 0$; and

v) assigning the amino acid residue or residues and

their respective selected rotamer or rotamer combinations
selected in step (iii) to the position(s) and moving to another
position along the sequence;

wherein the simulation steps are repeated until for each position along
the sequence, the residue and residue's rotamer with the lowest energy
score is selected, to obtain a virtually represented amino acid sequence with
the lowest total energy score;

f) expanding the reduced representation of the virtually represented
amino acid sequence obtained in step (e) to its corresponding all-atom
sequence representation thereby obtaining an amino acid sequence
compatible with the structure of the predetermined protein or peptide; and

g) outputting the expanded all-atom representation of the amino acid
sequence obtained in step (f),

wherein at least steps (b) – (f) are preformed on a sufficiently programmed
computer.

2. (Original) The method as claimed in claim 1, wherein the 3D structure provided in step (a) is that of a native peptide, or protein, or of a designed protein.

3. (Previously Presented) The method as claimed in claim 1, wherein the coordinate set is provided in a computer readable form.

4. (Previously Presented) The method as claimed in claim 1, wherein the amino acid sequence comprises naturally occurring amino acid residues, synthetic amino acid residues, or variations of the naturally occurring or synthetic amino acid residues.

5. (Previously Presented) The method as claimed in claim 1, wherein for each position along the 3D structure its solvent accessibility is determined according to the extent of exposure of the position to the solvent surrounding it, the position being either buried, exposed or intermediate position.

6. (Previously Presented) The method as claimed in claim 5, wherein the solvent is an aqueous solvent.

7. (Previously Presented) The method as claimed in claim 6, wherein the buried positions are occupied by hydrophobic amino acid residues.

8. (Previously Presented) The method as claimed in claim 7, wherein the hydrophobic amino acid residues are each independently selected from the group consisting of Ala, Tyr, Trp, Val, Leu, Ile, Phe, Met, Cys, Pro, and Gly.

9. (Previously Presented) The method as claimed in claim 5, wherein the exposed positions are occupied by hydrophilic amino acid residues.

10. (Previously Presented) The method as claimed in claim 9, wherein the hydrophilic amino acid residues are each independently selected from the group consisting of Lys, Arg, His, Glu, Asp, Gln, Asn, Ser, and Thr.

11. (Previously Presented) The method as claimed in claim 5, wherein the intermediate positions are occupied by either hydrophilic or hydrophobic amino acid residues.

12. (Previously Presented) The method as claimed in claim 11, wherein the intermediate positions are occupied by amino acid residues each being independently selected from the group consisting of Pro, Lys, Arg, His, Glu, Asp, Gln, Asn, Ser, Thr, Gly, Ala, Tyr, Trp, Val, Leu, Ile, Phe, Met, and Cys.

13. (Previously Presented) The method as claimed in claim 1, wherein the Monte Carlo simulation is applied simultaneously on up to three random positions in the sequence.

14. (Previously Presented) The method as claimed in claim 1, wherein the Monte Carlo step is conducted either at a fixed temperature or at a varying annealing temperature.

15. (Original) The method as claimed in claim 1, wherein a de novo amino acid sequence is generated.

16. (Previously Presented) The method as claimed in claim 1, wherein the amino acid sequence folds under physiological condition into a biologically functional 3D conformation substantially identical to the structure of the predetermined protein or peptide or to a portion thereof.

17. (Previously presented) The method as claimed in claim 15, wherein the de novo amino acid sequence stabilizes the 3D structure, as compared to a native amino acid sequence.

18. (Previously Presented) An amino acid sequence which folds under physiological conditions into a specified 3D structure, said amino acid sequence is obtained by the method of claim 1.

19-21. (Cancelled)

22. (Previously Presented) The method as claimed in claim 16, wherein the de novo amino acid sequence stabilizes the 3D structure, as compared to a native amino acid sequence.

23. (Cancelled)

24. (Previously Presented) The method as claimed in claim 1, wherein the method does not utilize the dead-end elimination algorithm to eliminate rotamers that are mathematically provable to be inconsistent with a global minimum energy solution of a system.

25. (Previously Presented) A computer-implemented method for predicting at least one amino acid sequence that folds into a specified three-dimensional (3D) structure of a predetermined reference protein or peptide, the at least one amino acid sequence having a biological activity the same as a biological activity of the reference protein or peptide;

consisting of:

a) providing a coordinate set representing the backbone of the 3D structure;

b) constructing a reduced virtual representation for the 3D structure provided in step (a), wherein in the reduced representation, each amino acid has a backbone portion and a side chain portion, the backbone portion of each amino acid being represented by a single sphere and the side chain of each amino acid being represented by one to three additional spheres;

c) determining for each amino acid position along the virtual structure representation provided in step (b) its solvent accessibility;

d) constructing an initial amino acid sequence by assigning for each amino acid position along the structure an amino acid residue selected randomly from a predefined group of amino acids having a solvent accessibility compatible with the solvent accessibility of the position;

e) randomly selecting one or more positions along the sequence provided in step (d) and applying on each position a Monte-Carlo simulation in sequence space and rotamer space, the simulation comprising one or more scoring function calculating steps which include:

i) randomly selecting one or more amino acid residues of the same solvent accessibility as that defined for the position to obtain a mutation;

ii) for each of the one or more selected positions, calculating an energy difference ΔE , between the amino acid residue at the position in the predetermined protein or peptide and each of the one or more selected amino acid residues provided in step (i) based on its the reduced virtual representation;

iii) selecting a rotamer having a minimal ΔE , or when more than one amino acid are manipulated simultaneously, selecting a rotamer combination having a minimal ΔE ;

iv) accepting the mutation with the rotamer or rotamer combination selected in step (iii) if $\Delta E < 0$; and

v) assigning the amino acid residue or residues and their respective selected rotamer or rotamer combinations selected in step (iii) to the position(s) and moving to another position along the sequence;

wherein the simulation steps are repeated until for each position along the sequence, the residue and residue's rotamer with the lowest energy score is selected, to obtain a virtually represented amino acid sequence with the lowest total energy score;

f) expanding the reduced representation of the virtually represented

amino acid sequence obtained in step (e) to its corresponding all-atom sequence representation thereby obtaining an amino acid sequence compatible with the structure of the predetermined protein or peptide; and

g) outputting the expanded all-atom representation of the amino acid sequence obtained in step (f),

wherein at least steps (b) – (f) are preformed on a sufficiently programmed computer.
